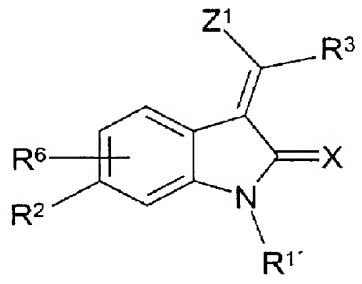
According to the invention, the novel compounds are obtained, for example, by the following processes, which are known in principle from the literature:

a. reaction of a compound of the formula



(V),

in which

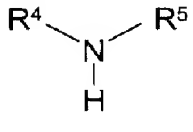
the radicals Z^1 and R^3 may, if appropriate, change their positions,

X, R^2, R^3 and R^6 are as defined at the outset,

$R^{1'}$ has the meanings mentioned at the outset for R^1 or is a protective group for the nitrogen atom of the lactam group, where R^1 may also, if appropriate, represent a bond, formed via a spacer, to a solid phase,

and Z^1 is a halogen atom, a hydroxyl, alkoxy or arylalkoxy group, for example a chlorine or bromine atom, a methoxy, ethoxy or benzyloxy group,

with an amine of the formula



(VI),

in which

R^4 and R^5 are defined as mentioned at the outset,

and, if required, the product is subsequently cleaved from a protective group used for the nitrogen atom of the lactam group or from a solid phase.

Suitable protective groups for the nitrogen atom of the lactam group are, for example, an acetyl, benzoyl, ethoxycarbonyl, tert-butyloxycarbonyl or benzyloxycarbonyl group and

suitable solid phases are a resin, such as a 4-(2',4'-dimethoxyphenylaminomethyl)-phenoxy resin, where the attachment is expediently via the amino group, or a p-benzyloxybenzyl alcohol resin, where the attachment is expediently via a spacer, such as a 2,5-dimethoxy-4-hydroxybenzyl derivative.

The reaction is expediently carried out in a solvent, such as dimethylformamide, toluene, acetonitrile, tetrahydrofuran, dimethyl sulphoxide, methylene chloride or a mixture thereof, if appropriate in the presence of an inert base, such as triethylamine, N-ethyldiisopropylamine or sodium bicarbonate, at temperatures between 20 and 175°C, where any protective groups used may be simultaneously removed owing to transamidation.

If, in a compound of the formula V, Z^1 is a halogen atom, the reaction is preferably carried out in the presence of an inert base at temperatures between 20 and 120°C.

If, in a compound of the formula V, Z^1 is a hydroxyl, alkoxy or arylalkoxy group, the reaction is preferably carried out at temperatures between 20 and 200°C.

The subsequent removal of a protective group used, which may be required, if appropriate, is expediently carried out either hydrolytically in an aqueous or alcoholic

solvent, for example in methanol/water, ethanol/water, isopropanol/water, tetrahydrofuran/water, dioxane/water, dimethylformamide/water, methanol or ethanol, in the presence of an alkali metal base, such as lithium hydroxide, sodium hydroxide or potassium hydroxide, at temperatures between 0 and 100°C, preferably at temperatures between 10 and 50°C,

or, advantageously, by transamidation with an organic base, such as ammonia, butylamine, dimethylamine or piperidine, in a solvent, such as methanol, ethanol, dimethylformamide and mixtures thereof, or in an excess of the amine used, at temperatures between 0 and 100°C, preferably at temperatures between 10 and 50°C.

(X),

in which

$R^{3'}$ is an amino, (C_{1-3}-alkylamino), di-(C_{1-3}-alkylamino) or C_{1-4}-alkoxy group and

n is the number 0 or 1.

The reaction is expediently carried out with palladium catalysis, using, for example, palladium(II) acetate, palladium(II) chloride, bis(triphenylphosphine)palladium(II) acetate, bis(triphenylphosphine)palladium(II) chloride, palladium/carbon, bis-[1,2-bis(diphenylphosphino)ethane]palladium(0), dichloro-(1,2-bis(diphenylphosphino)-ethane)palladium(II), tetrakistriphenylphosphinepalladium(0), tris(dibenzylidene-acetone)dipalladium(0), 1,1'-bis(diphenylphosphino)ferrocenedichloropalladium(II) or tris(dibenzylideneacetone)dipalladium(0)/chloroform adduct, in the presence of a base, such as triethylamine, diisopropylethylamine, lithium carbonate, potassium carbonate, sodium carbonate, caesium carbonate, and a ligand, such as triphenylphosphine, tri-ortho-tolylphosphine or tri-(tert-butyl)phosphine, in solvents such as acetonitrile, N-methylpyrrolidinone, dioxane or dimethylformamide and mixtures thereof.

The reaction with a corresponding reactive compound can, if appropriate, be carried out in the presence of a tertiary organic base, such as triethylamine, N-ethyl-diisopropylamine, N-methylmorpholine or pyridine, or, if an anhydride is used, in the presence of the

corresponding acids, at temperatures between 0 and 150°C, preferably at temperatures between 50 and 100°C.

The subsequent esterification or amidation is expediently carried out by reacting a reactive corresponding carboxylic acid derivative with an appropriate alcohol or amine, as described above.

The esterification or amidation is preferably carried out in a solvent, such as methylene chloride, diethyl ether, tetrahydrofuran, toluene, dioxane, acetonitrile, dimethyl sulphoxide or dimethylformamide, if appropriate in the presence of an inorganic or a tertiary organic base, preferably at temperatures between 20°C and the boiling point of the solvent used. Here, the reaction with a corresponding acid is preferably carried out in the presence of a dehydrating agent, for example in the presence of isobutyl chloroformate, tetraethyl orthocarbonate, trimethyl orthoacetate, 2,2-dimethoxypropane, tetramethoxysilane, thionyl chloride, trimethylchlorosilane, phosphorus trichloride, phosphorus pentoxide, N,N'-dicyclohexylcarbodiimide, N,N'-dicyclohexylcarbodiimide/N-hydroxysuccinimide, N,N'-dicyclohexylcarbodiimide/1-hydroxybenzotriazole, 2-(1H-benzotriazol-1-yl)-1,1,3,3-tetramethyluronium-tetrafluoroborate, 2-(1H-benzotriazol-1-yl)-1,1,3,3-tetramethyluronium tetrafluoroborate/1-hydroxybenzotriazole, N,N'-carbonyldiimidazole or triphenylphosphine/carbon tetrachloride, and, if appropriate, with addition of a base, such as pyridine, 4-dimethylaminopyridine, N-methylmorpholine or triethylamine, expediently at temperatures between 0 and 150°C, preferably at temperatures between 0 and 100°C, and the acylation with a corresponding reactive compound, such as its anhydride, ester, imidazolide or halide, is, if appropriate, carried out in the presence of a tertiary organic base, such triethylamine, N-ethyldiisopropylamine or N-methylmorpholine, at temperatures between 0 and 150°C, preferably at temperatures between 50 and 100°C.

The subsequent reduction of a nitro group is preferably carried out hydrogenolytically, for example with hydrogen in the presence of a catalyst, such as palladium/carbon or Raney nickel, in a solvent, such as methanol, ethanol, ethyl acetate, dimethylformamide, dimethylformamide/acetone or glacial acetic acid, if

The subsequent hydrogenation of a cyano group is preferably carried out hydrogenolytically, for example using hydrogen in the presence of a catalyst, such as palladium/carbon or Raney nickel, in a solvent, such as methanol, ethanol, ethyl acetate, methylene chloride, dimethylformamide, dimethylformamide/acetone or glacial acetic acid, if appropriate with addition of an acid, such as hydrochloric acid or glacial acetic acid, at temperatures between 0 and 50°C, but preferably at room temperature, and at a hydrogen pressure of from 1 to 7 bar, but preferably of from 3 to 5 bar.

The subsequent preparation of a corresponding guanidino compound of the formula I is expediently carried out by reaction with an amidino-group-transferring compound, such as 3,5-dimethylpyrazole-1-carboxamidine, preferably in a solvent, such as dimethylformamide, and, if appropriate, in the presence of a tertiary organic base, such as triethylamine, at temperatures between 0 and 50°C, preferably at room temperature.

In the reactions described above, any reactive groups present, such as carboxyl, hydroxyl, amino, alkylamino or imino groups, can be protected during the reaction by customary protective groups which are removed again after the reaction.

A protective radical for a carboxyl group is, for example, the trimethylsilyl, methyl, ethyl, tert-butyl, benzyl or tetrahydropyranyl group, and

a protective group for a hydroxyl, amino, alkylamino or imino group is, for example, the acetyl, trifluoroacetyl, benzoyl, ethoxycarbonyl, tert-butoxycarbonyl, benzyloxycarbonyl, benzyl, methoxybenzyl or 2,4-dimethoxybenzyl group, and, for the amino group, additionally the phthalyl group.

The subsequent removal of a protective radical used is, if appropriate, carried out, for example, hydrolytically in an aqueous solvent, for example in water, isopropanol/water, tetrahydrofuran/water or dioxane/water, in the presence of an acid, such as trifluoroacetic acid, hydrochloric acid or sulphuric acid, or in the presence of an alkali metal base, such as lithium hydroxide, sodium hydroxide or potassium hydroxide, at temperatures between 0 and 100°C, preferably at temperatures between 10 and 50°C.

However, a benzyl, methoxybenzyl or benzyloxycarbonyl radical is removed, for example, hydrogenolytically, for example using hydrogen in the presence of a catalyst, such as palladium/carbon, in a solvent such as methanol, ethanol, ethyl acetate, dimethylformamide, dimethylformamide/acetone or glacial acetic acid, if appropriate with addition of an acid, such as hydrochloric acid or glacial acetic acid, at temperatures between 0 and 50°C, but preferably at room temperature, and at a hydrogen pressure of from 1 to 7 bar, but preferably of from 3 to 5 bar.

A methoxybenzyl group can also be removed in the presence of an oxidizing agent, such as cerium(IV) ammonium nitrate, in a solvent, such as methylene chloride, acetonitrile or acetonitrile/water, at temperatures between 0 and 50°C, but preferably at room temperature.

However, a 2,4-dimethoxybenzyl radical is preferably removed in trifluoroacetic acid in the presence of anisole.

A tert-butyl or tert-butyloxycarbonyl radical is preferably removed by treatment with an acid, such as trifluoroacetic acid or hydrochloric acid, using, if appropriate, a solvent, such as methylene chloride, dioxane, ethyl acetate or ether.

A phthalyl radical is preferably removed in the presence of hydrazine or a primary amine, such as methylamine, ethylamine or n-butylamine, in a solvent, such as methanol, ethanol, isopropanol, toluene/water or dioxane, at temperatures between 20 and 50°C.

Furthermore, chiral compounds of the formula I obtained can be separated into their enantiomers and/or diastereomers.

Thus, for example, compounds of the formula I obtained which occur as racemates can be separated by methods known per se (see Allinger N. L. and Eliel E. L. in "Topics in Stereochemistry", Vol. 6, Wiley Interscience, 1971) into their enantiomers, and compounds of the formula I having at least 2 asymmetric carbon atoms can, owing to their physicochemical differences, be separated by methods known per se, for example by chromatography and/or fractional crystallization, into their diastereomers, which, if they are obtained in racemic form, can then be separated into the enantiomers as mentioned above.

The separation of enantiomers is preferably carried out by column separation on chiral phases or by recrystallization from an optically active solvent or by reaction with an optically active substance which forms salts or derivatives, such as, for example, esters or amides, with the racemic compound, in particular acids and their activated derivatives or alcohols, and separating the mixture of diastereomeric salts or derivatives obtained in this manner, for example owing to different solubilities, whereupon the free enantiomers can be released from the pure diastereomeric salts or derivatives by action of suitable agents. Particularly common optically active acids are, for example, the D and L forms of tartaric acid, dibenzoyltartaric acid, di-o-tolyltartaric acid, malic acid, mandelic acid, camphorsulphonic acid, glutamic acid, N-acetylglutamic acid, aspartic acid, N-acetylaspartic acid or quinic acid. A suitable optically active alcohol is, for example, (+)- or (-)-menthol, and a suitable optically active acyl radical in amides is, for example, the (+)- or (-)-menthyloxycarbonyl radical.

Furthermore, the compounds of the formula I obtained can be converted into their salts, in particular, for pharmaceutical use, into their physiologically acceptable salts, with inorganic or organic acids. Acids suitable for this purpose are, for example, hydrochloric acid, hydrobromic acid, sulphuric acid, phosphoric acid, fumaric acid, succinic acid, lactic acid, citric acid, tartaric acid, maleic acid, methanesulphonic acid,

ethanesulphonic acid, para-toluenesulphonic acid, phenylsulphonic acid or L-(+)-mandelic acid.

Moreover, the resulting novel compounds of the formula I can, if they contain a carboxyl group, then, if desired, be converted into their salts with inorganic or organic bases, in particular, for pharmaceutical use, into their physiologically acceptable salts. Bases suitable for this purpose are, for example, sodium hydroxide, potassium hydroxide, cyclohexylamine, ethanolamine, diethanolamine and triethanolamine.

Also suitable, for compounds of the formula I which contain 2 or more acidic or basic groups, are salts with 2 or more inorganic or organic bases or acids (disalts etc.).

Some of the compounds of the general formulae V to XI used as starting materials are known from the literature or can be obtained by processes known from the literature or can be obtained by the processes described above and in the examples. Compounds of the general formula IX, for example, are described in the German patent application 198 44 003.

As already mentioned at the outset, the novel compounds of the formula (I) have useful pharmacological properties, in particular in inhibiting action on various kinases, especially on receptor tyrosine kinases, such as VEGFR1, VEGFR2, VEGFR3, PDGFRα, PDGFRβ, FGFR1, FGFR3, EGFR, HER2, c-Kit, IGF1R and HGFR, Flt-3, and on the proliferation of cultivated human cells, in particular that of endothelial cells, for example in angiogenesis, but also on the proliferation of other cells, in particular of tumour cells.

The biological properties of the novel compounds were examined by the following standard methods:

Human umbilical cord endothelial cells (HUVEC) were cultivated in IMDM (Gibco BRL), supplemented with 10% foetal bovine serum (FBS) (Sigma), 50 µM ß-mercaptoethanol (Fluka), standard antibiotics, 15 µg/ml of endothelial cell growth

factor (ECGS, Collaborative Biomedical Products) and 100 µg/ml of heparin (Sigma) on gelatin-coated culture bottles (0.2 % gelatin, Sigma) at 37°C, 5% CO_2, in an atmosphere saturated with water.

To examine the inhibitory activity of the compounds according to the invention, the cells were "starved" for 16 hours, i.e. kept in culture medium without growth factors (ECGS + heparin). Using trypsin/EDTA, the cells were detached from the culture bottles and washed once with serum-containing medium. 2.5×10^3 cells were then seeded in each well.

The proliferation of the cells was stimulated using 5 ng/ml of $VEGF_{165}$ (vascular endothelial growth factor; H. Weich, GBF Brunswick) and 10 µg/ml of heparin. Per plate, as control value, in each case 6 wells were not stimulated.

The compounds according to the invention were dissolved in 100% dimethyl sulphoxide and, in triplicate, added to the cultures in different dilutions, the maximum dimethyl sulphoxide concentration being 0.3%.

The cells were incubated at 37°C for 76 hours, and ^{3}H-thymidine (0.1 µ Ci/well, Amersham) was then added for a further 16 hours to determine DNA synthesis. The radioactively labelled cells were then immobilized on filter mats and the incorporated radioactivity was determined in a β counter. To determine the inhibitory activity of the compounds according to the invention, the mean value for the non-stimulated cells was subtracted from the mean value of the factor-stimulated cells (in the presence or absence of the compounds according to the invention).

The relative cell proliferation was calculated in percent of the control (HUVEC without inhibitor), and the concentration of active compound at which the proliferation of the cells is inhibited by 50% (IC_{50}) was derived therefrom.

The compounds of the formula I according to the invention have an IC_{50} between 50 µM and 1 nM.

Owing to their inhibitory action on the proliferation of cells, in particular of endothelian cells and of tumour cells, the compounds of the formula I are suitable for treating diseases in which the proliferation of cells, in particular that of endothelial cells, plays a role.

Thus, for example, the proliferation of endothelial cells and the related neovascularization is a decisive step in tumour progression (Folkman J. et al., Nature 339, 58-61, (1989); Hanahan D. and Folkman J., Cell 86, 353-365, (1996)). Furthermore, the proliferation of endothelial cells is also of importance in haemangiomes, in metastasization, in rheumatoid arthritis, in psoriasis and in ocular neovascularization (Folkman J., Nature Med. 1, 27-31, (1995); Carmeliet P & Rakeh J., Nature 407, 249-257, (2000)). The therapeutic benefit of inhibitors of endothelial cell proliferation in the animal model was shown, for example, by O'Reilly et al. and Parangi et al. (O'Reilly M.S. et al., Cell 88, 277-285, (1997); Parangi S. et al., Proc Natl Acad Sci USA 93, 2002-2007, (1996)).

Thus, the compounds of the formula I, their tautomers, their stereoisomers or their physiologically acceptable salts are suitable, for example, for treating tumours (for example squamous epithelium carcinoma, astrocytoma, Kaposi sarcoma, glioblastoma, lung cancer, cancer of the bladder, neck carcinoma, oesophagus carcinoma, melanoma, ovarial carcinoma, prostate carcinoma, breast cancer, small-cell lung carcinoma, glioma, colorectal carcinoma, pancreas carcinoma, urogenital cancer and gastrointestinal carcinoma, and also haematological cancers, such as, for example, multiple myeloma and acute myelotic leukaemia), psoriasis, arthritis (for example rheumatoid arthritis), haemangioma, angiofibroma, disorders of the eye (for example diabetic retinopathy), neovascular glaucoma, disorders of the kidneys (for example glomerulonephritis), diabetic nephropathy, malignant nephrosclerosis, thrombic microangiopathic syndromes, transplantation rejections and glomerulopathy, fibrotic disorders (for example cirrhosis of the liver), mesangial-cell-proliferative disorders, atherosclerosis, injuries of the nerve tissue and for inhibiting the reocclusion of vessels after balloon catheter treatment, in vessel prosthetics or

after implantation of mechanical devices for keeping vessels open (for example stents) or other disorders in which cell proliferation or angiogenesis play a role.

Owing to their biological properties, the compounds according to the invention can be used alone or in combination with other pharmacologically active compounds, for example in tumour therapy in monotherapy or in combination with other antitumor therapeutics, for example in combination with topoisomerase inhibitors (for example etoposide), mitosis inhibitors (for example vinblastine, Taxol), compounds which interact with nucleic acids (for example cisplatin, cyclophosphamide, adriamycin), hormone antagonists (for example tamoxifen), steroids and analogues thereof (for example dexamethasone), inhibitors of metabolic processes (for example 5-FU etc.), cytokines (for example interferons), kinase inhibitors (for example EGFR kinase inhibitoren, such as, for example, Iressa; Gleevec), allosterically acting receptor tyrosine kinase inhibitors, antibodies (for example Herceptin), COX-2 inhibitors or else in combination with radiotherapy, etc. These combinations can be administered either simultaneously or sequentially.

Abbreviations used:

HOBt = 1-hydroxy-1H-benzotriazole

TBTU = O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium tetrafluoroborate

Preparation of the starting materials:

Example I:

Dimethyl 2-(4-fluoro-2-nitrophenyl)malonate

With ice-cooling, 185 g of potassium *tert*-butoxide are added to a solution of 188 ml of dimethyl malonate in 970 ml of N-methylpyrrolidone, and the mixture is stirred for 2 hours. Over a period of 30 minutes, 150 ml of 2,5-difluoronitrobenzene are added dropwise to the resulting slurry, and the mixture is then stirred at 85°C for 6 hours. The mixture is poured into 4 liters of ice-water and 250 ml of concentrated hydrochloric acid and extracted with 2 liters of ethyl acatate. The organic phase is dried with sodium sulphate and concentrated. The oily residue is triturated twice with water and then taken up in 600 ml of ethyl acetate. The solution is dried with sodium sulphate and concentrated to dryness. The resulting crude product is recrystallized from 600 ml of ethyl acetate/hexane = 2:8 and dried.

Yield: 222 g (59% of theory)

R_f value: 0.40 (silica gel, cyclohexane/ethyl acetate = 5:1)

$C_{11}H_{10}FNO_6$

Mass spectrum: m/z = 270 $[M-H]^-$

$C_{12}H_{10}N_2O_6$

Mass spectrum: m/z = 277 $[M-H]^-$

Example II:

Methyl 4-cyano-2-nitrophenylacetate

14.2 g of dimethyl 2-(4-cyano-2-nitrophenyl)malonate (starting material I.2) are dissolved in 200 ml of dimethyl sulphoxide, and 4.5 g of lithium chloride and 1.0 ml of water are added. The solution is stirred at 100°C for 3.5 hours, 300 ml of ice-water are then added and the mixture is allowed to stand for 12 hours. The resulting precipitate is filtered off with suction, taken up in methylene chloride and washed with water. The organic phase is dried over sodium sulphate, concentrated using a rotary evaporator and dried.

Yield: 7.7 g (68% of theory)

R_f value: 0.40 (silica gel, methylene chloride/methanol) = 50:1

Example III:

4-Fluoro-2-nitrophenylacetic acid

At 100°C, 50.0 g of dimethyl 2-(4-fluoro-2-nitrophenyl)malonate (starting material I) are stirred in 400 ml of 6 molar hydrochloric acid for 20 hours, 400 ml of water are then added and the mixture is cooled to 0°C. The resulting precipitate is filtered off with suction, washed with water and 100 ml of petroleum ether and dried.

(B): silica gel, methylene chloride/ethanol 10:1

(C): silica gel, methylene chloride/methanol 4:1

Example 2.0

3-Z-[1-(4-(Dimethylaminomethyl)anilino)-1-(4-cyanophenyl)methylene]-6-chloro-2-indolinone

1.07 g of 1-acetyl-3-[1-chloro-1-(4-cyanophenyl)methylene]-6-chloro-2-indolinone (starting material VII) and 0.54 g of 4-(dimethylaminomethyl)aniline (starting material IX.4) are dissolved in 10 ml of dimethylformamide and stirred at 80°C for 3 hours. After cooling, 1 ml of 6N aqueous sodium hydroxide is added, and the mixture is stirred at room temperature for 30 minutes. Water is added and the mixture is extracted three times with methylene chloride. The combined organic phases are washed twice with water, dried over sodium sulphate and concentrated using a rotary evaporator, and the product is recrystallized from diethyl ether.

Yield: 0.92 g (72% of theory),

R_f value: 0.1 (silica gel, methylene chloride/methanol = 9:1)

Mass spectrum: m/z = 427/429 $[M-H]^-$

Example 3.0

3-Z-[1-(4-(dimethylaminomethyl)anilino)-1-(4-iodophenyl)methylene]-6-fluoro-2-indolinone

3.5 g of 1-acetyl-3-(1-methoxy-1-(4-iodophenyl)methylene)-6-fluoro-2-indolinone (starting material VII.11) and 1.6 g of 4-(dimethylaminomethyl)aniline (starting material IX.4) are dissolved in 30 ml of dimethylformamide and stirred at 120°C for 2 hours. After cooling, the solvent is removed under reduced pressure, the residue is taken up in 30 ml of methanol and 2 spatula tips of sodium methoxide are added. Once a yellow precipitate has formed, this is filtered off with suction from the solvent and the residue is washed with a little methanol and ether and finally dried under reduced pressure at 100°C.

Yield: 1.9 g (46% of theory),

R_f value: 0.3 (silica gel, methylene chloride/methanol = 9:1)

Mass spectrum: m/z = 514 $[M+H]^+$

Example 11.0

3-Z-[1-(4-Dimethylaminomethylanilino)-1-(3-(2-carbamoylethyl)phenyl)methylene]-6-chloro-2-indolinone

480 mg of 3-Z-[1-(4-dimethylaminomethylanilino)-1-(3-(2-carboxyethyl)phenyl)methylene]-6-chloro-2-indolinone (starting material 10.0), 350 mg of TBTU, 150 mg of HOBt and 420 ml of triethylamine are dissolved in 10 ml of dimethylformamide, and 620 mg of N-hydroxysuccinimide ammonium salt are added. The mixture is stirred at room temperature for 20 hours. After removal of the solvent under reduced pressure, the residue is suspended in a little ethyl acetate and water, filtered off and washed with water. The residue is purified on an alumina column (activity 2-3) using the mobile phase methylene chloride/ethanol 20:1. The product is recrystallized from diethyl ether and dried under reduced pressure at 100°C.

Example 12.0

3-Z-[1-(4-Dimethylaminomethylanilino)-1-(4-acetylaminomethylphenyl)methylene]-6-chloro-2-indolinone

100 mg of 3-Z-[1-(4-dimethylaminomethylanilino)-1-(4-aminomethylphenyl)-methylene]-6-chloro-2-indolinone (starting material 7.0) are dissolved in 5 ml of methylene chloride and 5 ml of pyridine, and 20 µl of acetyl chloride are added at 0°C. The mixture is stirred at 0°C for 10 minutes and at room temperature for a further 4 hours. Another 20 µl of acetyl chloride are then added, and the mixture is stirred at room temperature for 12 hours. After this time, the solvent is removed under reduced pressure and the residue is taken up in methylene chloride and washed with water. The aqueous phase is extracted twice with methylene chloride and the combined organic phases are dried over sodium sulphate. The solvent is removed using a rotary evaporator and the residue is washed with ether.
